

Biology

Date : _____
Page No : _____

- 1) The left atrium receives oxygenated blood from the lungs
- 2) The largest artery of the body is Aorta.
- 3) Translocation is the movement of the useful materials formed after the photosynthesis (glucose) from the leaves to all the tissue of the plant
- 4) Functions of Lymph are
 - i) It provides nutrient and oxygen to different part of body where blood cannot reach
 - ii) It absorbs the excess fat which is formed due to fat metabolism in small intestine and transfer them to lymphatic system
 - iii) Due to the presence of leucocytes the lymphatic system also helps in removing the pathogens in our body
