

12. X is CaCO_3 - Calcium carbonate

Y is Ca(OH)_2 - slaked lime

Z is CaOCl_2 - Bleaching powder

G is Cl_2 - Chlorine gas

13.

(i) The solution will turn light green from blue due to formation of ferrous sulphate

(ii) Iron nail will develop a reddish brown layer of

copper metal

(iii) White

(iv) Dil. HCl decomposes BaCl_2 , SO_2 and H_2O . Since BaCl_2 is soluble in water. White precipitate disappears.

Biology

1. (2) Salivary amylase

2. (3) Nostoc

3. (1) Antennules

11. Light energy is absorbed by chlorophyll which breaks down H_2O molecule into hydrogen and oxygen.

↳ Light energy is converted into chemical energy

• Reduction of CO_2 into carbohydrates

12. Arteries - Veins

~~They contain~~
~~valves~~

Blood pressure

Blood pressure

is high in arteries and low in veins

• Arteries end in capillaries, veins start in capillaries

• Bring blood to organs, collect blood from organs

13

(i) Salivary amylase

(ii) Small intestine

4. (1) Gums

5. (1) Gills

6. (2) Pericardium

7. (1) Lymph

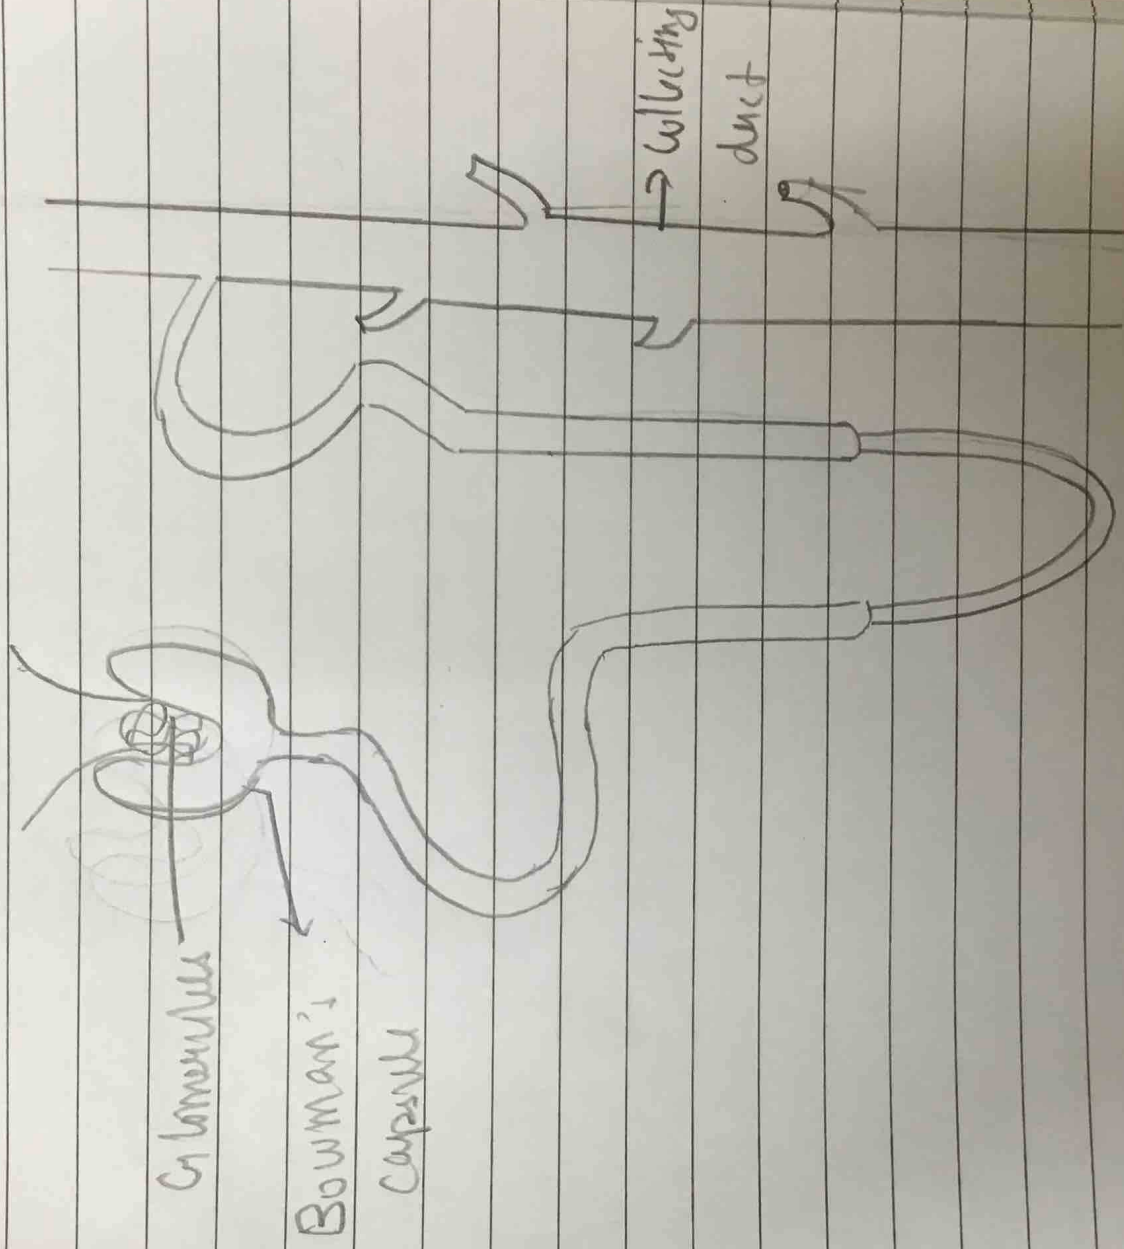

8. The final products are $\rightarrow$ sugars, amino acids, fatty acids and glycerol.

9. Aerobic takes place in the presence of oxygen. Anaerobic takes place in the absence of oxygen.

Can be found in cytoplasm and mitochondria. Can be found only in cytoplasm.

10. To separate oxygenated blood and deoxygenated blood and increase the efficiency of cellular respiration and helps in maintaining a constant body temperature.

iv) Viri are finger like projections. Help in the absorption of nutrients

(d) It helps by protecting from any sudden stimulus which may harm us and thus take care of the survival of any organism
