Biology

Ans 1. (1) Knee Jerk

Ans 2. (4) Both A and B

Ans 3. (1) p

Ans 4. Gonads are the glands that produce hormones that are involved in reproduction. These hormones include estrogen and progesterone in female and testosterone in male.

Ans 5. Double fertilization is a trait in flowering plants. In this phenomenon, one female gamete unites with two male gametes. One of the male gametes fertilizes the egg resulting in the formation of a zygote and the other unites with 2 polar nuclei for the formation of an endosperm.

Ans 6. (i) The other name of pituitary gland is Master gland as it regulates the hormonal secretion in our body. If there is a hypersecretion it can lead to gigantism and if there is a hyposecretion it can lead to dwarfism in the body.

(ii) The thyroid gland needs iodine to produce the hormone thyroxine, if there is a shortage of thyroxine in our body it can lead to goitre and also neck swelling happens, in order to prevent this and have a regular secretion of thyroxine by the thyroid gland, iodine is advised as Iodized salt.
