Biology

1. The enzyme present in human saliva is Lysozyme.
Lysozyme kills germs and bacteria present in food.
 2. Peristalsis is a wave-like movement. It is the contraction and relaxation of muscles. Peristalsis occurs in Oesophagus, stomach, small intestine and large intestine. It helps in smooth transportation of food and other minerals and also helps to mix acid with food.
 3. Pseudopodia or false feet is the special structure in amoeba help it intake of food. When amoeba comes closer to a food particle, finger-like projections called Pseudopodia emerges from amoeba and start encircling the food particle. When the tips of ~~the~~ Pseudopodia ~~too~~ touch each other, it forms a food vacuole where further digestion takes place.
 4. The Acid present in our stomach is Hydrochloric Acid (HCl).
Its Ph value is between 1.5 to 2. It is highly acidic. It play a crucial role in digestion of food in stomach.
- ★ It activates Pepsinogen & Prorennin to ~~the~~ Pepsin and Rennin
- | | | |
|------------|----------------------------|--------|
| Pepsinogen | $\xrightarrow{\text{HCl}}$ | Pepsin |
| Prorennin | $\xrightarrow{\text{HCl}}$ | Rennin |

☆ It stops the digestion of starch by salivary amylase.

☆ It kills harmful germs & bacteria present in food.
