

BIOLOGY

1. Salivary Amylase

2. Stomata

3. All of these Veins

4. Both (1) and (2)

5. Gills

6. Pericardium

7. Lymph

8. Sugars - Glucose, Protein - Amino acids, fats - fatty acids and glycerol are formed.

9. Aerobic

It takes place in the presence of oxygen.

Carbohydrates, proteins and lipids are broken down completely.

Gases are exchanged in form of respiration

Anaerobic

It takes place without the presence of oxygen.

Incomplete breakdown of substrate.

Gases are not exchanged in the form of oxygen.

It can be found in Cytoplasm and mitochondria.

It can be found only in the cytoplasm.

All higher organism such as mammals have this type

All lower organisms such as bacteria and yeast type.

10. Double Circulation means the blood flows twice in human body. This is necessary because when the blood is transported from arteries to the whole body that particular blood contains oxygen it is a oxygenated blood, blood needs to filter that is done by heart and the blood reaches to the heart by veins from whole body. Because heart also needs blood as well as heart also filters the blood.

11. There are some events that occurred during photosynthesis -

(i) light energy is absorbed by chlorophyll which breaks down water molecules into hydrogen and oxygen.

(ii) light energy is converted to Chemical energy.

(iii) The reduction of carbondioxide leads to the formation of carbohydrates.

17.

Arteries

Arteries carry blood away from the heart.

Arteries carry oxygenated blood

Arteries have thick walls with muscle tissue.

Veins

Veins carry blood towards the heart.

Veins carry deoxygenated blood.

Veins have thin walls and use valves to keep blood flowing.

18.

(i) Salivary Amylase

(ii) HCl [Hydrochloric acid], Pepsin and Lipase

(iii) Small Intestine

(iv) Villi are finger like projections which are used to increase the surface area.

14.

(B) Reflex action is involuntary response of effectors to stimulus. It helps us in protecting us from any sudden stimulus which may harm us and thus takes care of the survival of an organism.
