

Biology

1- (2) Salivary Amylase.

2- (3) Nostoc

3- (2) Veins

4- (3) Both (1) and (2).

5- (1) Gills.

6- (2) Pericardium

7- (1) Lymph.

8- glucose, fructose

9- Aerobic Respiration

- Takes place in presence of oxygen

- Complete breakdown of glucose

- Glucose + Oxygen $\rightarrow$ Carbon dioxide + water + ATP

- Occurs in Cells

Anaerobic Respiration.

- Takes place in absence of oxygen.

- Incomplete breakdown of Glucose.

- Glucose $\rightarrow$ Lactic Acid. Alcohol + Carbon dioxide + ATP

- Occurs in Muscles.

- 10- Double circulation of blood keeps oxygenated blood separate from deoxygenated blood. This results in more efficient circulation of blood because a greater amount of oxygen rich blood can be delivered to the tissues and it also maintain constant body temperature.
- 11- The three events that occur during photosynthesis are:-
- (1) Absorption of light energy by chlorophyll.
 - (2) Conversion of light energy to chemical (in the form of ATP and NADPH) and splitting of water molecules into hydrogen & oxygen.
 - (3) Reductions of carbon dioxide to carbohydrates (carbon assimilation).

Q13

- a)
b)
c)
d)

Q14

a)

12-

Arteries

- They carry blood away from the heart.
exception - pulmonary artery
- They have thick walls with muscle tissue
- Do not have valves

Veins

- They carry blood towards the heart.
exception - pulmonary veins.
- They have thinner walls ~~and~~ ~~valves to keep your blood flowing.~~
- They have valves to keep your blood flowing.

Q13

- a) Salivary ~~Amylase~~ Amylase / Ptyalin.
- b) Hydrochloric acid, enzyme pepsin & mucus.
- c) Small intestine.
- d) Villi are finger-like projections which are richly supplied with blood vessels. They are present in the inner lining of the small intestine and helps in absorption of nutrients by increasing the surface area of absorption.

Q14

a)

- b) Reflex action is involuntary response of effectors to the stimulus and it helps us in protecting us from any sudden stimulus which may harm us & thus takes care of survival of organisms.
